S51881
MSNI protein - yeast (Saccharomyces cerevisiae)
MSNI protein - yeast (Saccharomyces cerevisiae)
N;Alternate names: FUP1 protein; protein HRB382; protein 00713; protein YOL116w
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Accession: 551881; S12325; S59157; S22771; S66812
R;Vandenbol, M.; Durand, P.; Porteteile, D.; Hilger, F.
submitted to the EMBL Data Library, January 1995
A;Destription: Sequence analysis of a 44kb DNA fragment of yeast chromosome XV including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A,Molecule type: DNA

AyZ097

Hypothetical protein asr2330 [imported] - Nostoc sp. (strain PCC 7120)

C;Species: Nostoc sp. PCC 7120 is a synonym of Anabaena sp. strain PCC 7120

C;Species: Nostoc sp. pcC 7120 is a synonym of Anabaena sp. strain PCC 7120

C;Accession: Ac2097

C;Accession: Ac2097

C;Accession: Ac2097

Genome polyprotein (Contains: Coat protein VP4 (PIA); Coat protein VP2 (PIB); Coat protein VP3 (PIC); Coat protein VP1 (PID); Picornain 2A
                                                                                                                                                                                                                                                                                               Veast 11:1069-1075(1995).
Yeast 11:1069-1075(1995).
-!- FUNCTION: May function as a transcriptional activator. Increased dosage of MSN1 restores invertase expression in yeast mutants defective in the SNF1 protein kinase, and msn1 disruption reduced derepression of invertase in the wild type. May affect SUC2 expression. Expression of MSN1 enhances growth in iron-limiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TRANSFAC; T03501,

                                                                                                                                                                                                                         VP3, and VP4.

PTM: Specific enzymatic cleavages in vivo yield mature proteins.

MISCELLANEOUS: THIS VIRUS IS A LIVE VACCINE STRAIN DERIVED FROM

THE MAHONEY STRAIN BY SPONTANEOUS MUTATIONS DURING THE ATTENUATION
                Proc. Natl. Acad. Sci. U.S.A. 79:5793-5797(1982).

-I- PUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTAIN Q/G SITES IN THE POLYPEPTIDE II MAY BE A CYSTEINE PROTEASE.

-I- CATALYTIC ACTIVITY: Selective cleavage of Gln-|-Gly bond in the poliovirus polyprotein. In other picornavirus reactions Glu may substituted for Gln, and Ser or Thr for Gly.

-I- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + RNA (N).

-I- SUBUNIT: The virus capsid is composed of 60 icosahedral units, each of which is composed of one copy each of proteins VPI, VP2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            COAT PROTEIN V.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diphosphate + L-argininosuccinate.
-!- PATHWAY: Arginine biosynthesis; seventh step.
-!- SUBGUNT: Homotetramer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the argininosuccinate synthase family.
Subfamily 1.
           -!- PATHWAY: Arginine biosynthesis; seventh step.
-!- SUBUNIT: Homotetramer (By similarity).
-!- SUBCELDULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the argininosuccinate synthase family.
Subfamily 1.

TISSUE SPECIFICITY: Expressed preferentially in liver, heart, and
                  -1- COFACTOR: Self-glucosylation is dependent on the presence of divalent metal ions of which manganese ion is the most effective.
-1- PATHWAY: Glycogen biosynthesis.
-1- SUBDWIT: Homodimer, tightly complexed to glycogen synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                UDP-GLUCCOSE TO ITSELF, FORMING AN ALPHA-1,4-GLYCAN OF AROUND 10 RESIDUES ATTACHED TO TYR-228.

MASS SPECTROMETRY: WW-55211.89; METHOD=MALDI.

-I-FUNCTION: Direct ligand for the ERBB tyrosine kinase receptors.

-I-FUNCTION: Direct ligand for the ERBB tyrosine kinase receptors.

The multiple isoforms perform diverse functions: Cystein-rich domain containing isoforms (isoforms 2-4) probably regulate the expression of nicotinic acetylcholine receptors at developing interneuronal synapses. The Ig-NG isoform is required for the initial induction and/or maintenance of the mature levels of acetylcholine receptors at neuromuscular synapses.

-I-SUBCELLULAR LOCATION: Exists as a type I membrane protein and as a proteolytically released soluble growth factor form. The membrane-bound form does not seem to be active (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STRAIN=White leghorn, TISSUE-Brain;

                                                                                                                                                                                                                           DEVELOPMENTAL STAGE: Isoforms 2-4 are detected at embryonic day 4 (ED4) in both visceral and somatic motor neurons of spinal cord and is highest at ED6. Isoform 1 is not expressed until ED 6 in spinal cord. AE ED 11 both isoforms display comparable levels. DOMAIN: The cytoplasmic domain may be involved in the regulation of trafficking and proteolytic processing. Regulation of the proteolytic processing involves initial intracellular domain DOMAIN: ERBB receptor binding is elicited entirely by the EGF-like

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the Buropean Bioinformatics Institute. There are no restrictions on its was by non-profit institutions as long as its content is no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to licenseaisb-sib.ch). Comment-Additions lasforms seem to exist. Isoforms have been Comment-Additional isoforms seem to exist. Isoforms have been classified as type I NRGS (isoforms with an Ig domain and a glycosylation domain, isoforms 1-8), type II NRGS (isoforms with an Ig domain but no glycosylation domain, isoform 9) and type II NRGS (isoforms with a Cys-rich domain, isoform 9) and type II NRGS (isoforms with a Cys-rich domain, isoform 9). All these isoforms perform distinct tissue-specific functions; Name-1; Synonyms-Alpha; Isoforms sequence-Displayed; Isoforms-Alpha, Isoforms-2; Synonyms-Alpha, Isoforms-2; Synonyms-2; Synonyms Isold=015491-1; Sequence=External;
TISSUE SPECIFICITY: Type I isoforms are the predominant forms expressed in the endocardium. Isoform alpha is expressed in the endocardium. Isoform alpha is expressed in breast, ovary, testis, prostate, heart, skeletal muscle, lung, placenta liver, kidney, salivary gland, small intestine and brain, but not in uterus, stomach, pancreas, and spleen. Isoform 3 is the predominant form in mesenchymal cells and in nonneuronal organs, whereas isoform 5 is the major neuronal form. Isoform 8 is expressed in spinal cord and brain. Isoform 9 is the major form in skeletal muscle cells; in the nervous system it is expressed in spinal cord and brain. Also detected in adult heart, placenta, DOMAIN: ERBB receptor binding is elicited entirely by the EGF-like Extensive glycosylation precedes the proteolytic cleavage (By lung, liver, kidney, and pancreas.

DEVELOPMENTAL STAGE: Detectable at early embryonic ages.

DOMAIN: The cytoplasmic domain may be involved in the regulation of trafficking and proteolytic processing. Regulation of the proteolytic processing involves initial intracellular domain dimerization (By similarity). PTM: Proteolytic cleavage close to the plasma membrane on the external face leads to the release of the soluble growth factor VSP_003426, VSP_003429, membrane-bound form does not seem to be active. The secreted isoform 9 has a signal peptide. The isoform 8 may be nuclear. ALTERNATIVE PRODUCTS: proteolytically released soluble growth factor form. The IsoId=Quzzz,-c, c.,

## ALIGNMENTS

Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder. Novel human diagnostic protein #12435 ABG12444 standard; protein; 378 AA

Claim 20; SEQ ID NO 42803; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging

The present sequence is that of a TTV polypeptide, useful to the invention. (Updated on 07-AUG-2003 to correct OS field.) (Updated on 29-
         involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic manno acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
   expressing (II). (I) and (II) are useful for treating disorders aberrant protein expression or biological activity. The

The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as promyonococcal ureritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these diseases
                                                                                                                                                                                                       Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, bartholinitis, pneumopathy, venereal lymphogranulomatosis.

This invention describes a novel non-human transgenic animal (I) whose germ cells and somatic cells contain a knockout mutation in DNA encoding a 4E-BP1 (a member of eukaryotic initiation factor 4E (eIF-4E)-binding protein 1) shows a phenotype of an altered glucose and/or fat metabolism when compared to a control animal. The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, also useful for selection and identification of modulators of the expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorders. The effect of the disruption of 4E-BP1 in the knockout mice demonstrates that an alteration of 4E-BP1 in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bukaryotic initiation factor; eIF4E; transgenic animal; antidiabetic;

germ cells and sometic cells contain a knockout mutation in DNA encoding a 4E-BP1 (a member of eukaryotic initiation factor 4E (eIF-4E)-binding protein 1) shows a phenotype of an altered glucose and/or fat metabolism when compared to a control animal. The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BPI in the knockout mice demonstrates that an alteration of 4E-BPI on modulate fat tissue growth, glucose metabolism and weight gain in an animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryotic initiation factor; eIF4E; transgenic animal; antidiabetic; knockout mutation; 4E-BP1; glucose metabolism; fat metabolism; anorectic; drug; anti-obesity; anti-fat deposition; anti-metabolic.
                                                                                                                                                                                                                                 Non-human transgenic animal useful as model for studying lipid and glucose metabolism, has germ and somatic cells containing knockout mutation in DNA encoding eukaryotic initiation factor 4E-binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

germ cells and gonatic cells contain a knockout mutation in DNA encoding a 4E-BP1 (a member of eukaryotic initiation factor 4E (eIF-4E)-binding protein 1) shows a phenotype of an altered glucose and/or fat metabolism when compared to a control animal. The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BP1 in the knockout mice demonstrates that an alteration of 4E-BP1 can modulate fat tissue growth, glucose metabolism and weight gain in an animal Score 26; DB 3; Length 16; Pred. The effects of 4E-BPl are strictly dependent on its ability to sequester the translation initiation factor elF4E, thereby preventing its assembly into an active pre-initiation complex. The specification describes a method for inducing apoptosis in a cell in which the apoptosis pathway is inhibited. The method comprises decreasing the amount of elF4E pre-initiation complex by sequestration of elF4E, thus relieving an apoptosis block. The method is useful for modulating pro-apoptotic and anti-apoptotic pathways in cells, especially in Ras-transformed cells. Thus, the method is particularly useful for treating cancer. The elF4E sequestering agent, 4E-BP1 or its elF4E binding portion is useful for treating high proliferative cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inducing apoptosis in a cell in which the apoptosis pathway is inhibited, useful for treating cancer or highly proliferative cells, comprises decreasing the amount of elf4F pre-initiation complex, relieving an apoptosis block.
useful for treating cancer. The elF4E sequestering agent, 4E-BP1 or it elF4E binding portion is useful for treating high proliferative cells

The present sequence is that of human eukaryotic initiation factor 4E (a1F-4E) binding protein 4E-BP2, as predicted from a cDNA clone (see AAR50622) isolated from a placenta cDNA library. 4E-BP2 protein binds to e1F-4E and causes a modulation of translation in a cell in response to a hormone. Phosphorylation of the protein, e.g. in response to insulin, causes its release from e1F-4E and a consequent stimulation of translation. 4E-BP2 shows 56% amino acid identity to 4E-BP1 (see AAV96147). It can be used in a method for screening for non-hormone agents potentially useful for treating a hormone disorder. The method involves contacting a potential agent with a system (e.g. in vitro translation system) containing a cellular component and a translation of factor. The component and factor interact in an intact normal cell in a containing a totenthose decrease a modulation of translation by the component and the factor autologous to the cell. The method involves determining whether the agent causes a condulation of translation by the component and the factor autologous to the call of the normone disorders such as a useful for prophylaxis and treatment of hormone disorders such as diabetes. The agent is useful as a hormone substitute and also in test systems to allow an understanding of the action of the hormone. The improved drugs for treating diabetes mellitus are more convenient to administer than insulin, avoid the side effects of oral hypoglycemic drugs and carry a reduced risk of inducing severe hypoglycemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human cellular component that binds to translation factor eIF-4E causing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to screening methods for identifying agents that mimic the activity of a hormone. The method comprises a test agent with sequestered by a solutioning a complex comprises a test agent with sequestered by a cellular component, where the complex responds to hormone treatment by releasing the translation factor, and determining if the test agent causes the release of the translation factor by an assay that directly measures the translation factor and/or the cellular component or an assay that measures the activity of the released translation factor by measuring the expression of a reporter polypeptide from a reporter construct. Inhibitors of a hormone can also be identified using a similar method. The methods are useful for screening for drugs useful in the treatment of hormonal disorders, especially diabetes. The translation factor used is eIF-4B. The present sequence represents a human eIF-4B-binding protein 4B-BP2 that can be used as a cellular factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening assay for modulators of hormone activity - based on hormonedependent release of translation factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                          encoding a cellular component that binds to eIF-4E (not defined) and causes a modulation of translation in a cell in response to a hormone. The invention comprises a coding sequence for the proteins 4E-BP1 or 4E-BP2. The nucleic acid encodes a protein that binds to eIF-4E and causes a modulation of translation in a cell in response to a hormone. The protein encoded by the nucleic acid may be used in controlling gene expression. It may be used in this way to treat hormonal disorders (e.g. diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Addison's disease) or hyperfunctions (e.g. Cushing's syndrome), the phechromocytoma, multiple endocrine neoplasias, polyglandular deficiency syndromes, and disorders of reproductive function. The present amino acid sequence represents the human eIF-4B-binding protein 4B-BP2 of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bukaryotic initiation factor; eIP4E; transgenic animal; antidiabetic;

This invention describes a novel non-human transgenic animal (I) whose germ cells and somatic cells contain a knockout mutation in DNA encoding a 4E-BPI (a member of Eukaryotic initiation factor 4E (eIF-4E)-binding protein 1) shows a phenotype of an altered glucose and/or fat metabolism when compared to a control animal. The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the cerry spression and/or activity of 4E-BPI and for sereening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorders. The effect of the disruption of 4E-BPI in the knockout mice demonstrates that an alteration of 4E-BPI can modulate fat tissue growth, glucose metabolism and weight gain in an animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bukaryotic initiation factor; eIF4E; transgenic animal; antidiabetic; knockout mutation; 4E-BP1; glucose metabolism; fat metabolism; anorectic; drug; anti-obesity; anti-fat deposition; anti-metabolic.
                                                                                                                                                                                                                                                                                                     Non-human transgenic animal useful as model for studying lipid and glucose metabolism, has germ and somatic cells containing knockout mutation in DNA encoding eukaryotic initiation factor 4E-binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

germ cells and somatic cells contain a knockout mutation in DNA encoding at 4B-BPI (a member of eukaryotic intitation factor 4E (eIF-4E)-binding protein 1) shows a phenotype of an altered glucose and/or fat metabolism when compared to a control animal. The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the expression and/or activity of 4E-BPI and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BPI in the knockout mice demonstrates that an alteration of 4E-BPI can modulate fat tissue growth, glucose metabolism and weight gain in an animal This invention describes a novel non-human transgenic animal (I) whose

## ALIGNMENTS

RESULT 1 B71493 probable RNA polymerase sigma-54 - Chlamydia trachomatis (serotype D, strain UM3/Cx) C;Species: Chlamydia trachomatis C;Species: Chlamydia trachomatis C;Accession: E71493 R;Stephens, R.S.; Kalman, S.; Lammel, C.J.; Fan, J.; Marathe, R.; Aravind, L.; Mitchell, Science 282, 754-759, 1998 A;Title: Genome sequence of an obligate intracellular pathogen of humans: Chlamydia trach A;Reference number: A71570; MUD:99000809; PMID:9784136 A;Status: preliminary A;Molecule type: DNA
A; Residues: 1-436 <arn> A; Cross-references: GB:AE001331; GB:AE001273; NID:g3329046; PIDN:AAC68212.1; PID:g332905: A; Experimental source: serotype D, strain UM-3/Cx C; Genetics: A; Gene: rpoN C; Superfamily: Pseudomonas transcription initiation factor sigma</arn>
